## EQUIDISTANT OR GLOBULAR PROJECTION

## SANSON-FLAMSTEED'S PROJECTION

## POLAR PROJECTIONS

## MOLLWEIDE'S HOMALOGRAPHIC PROJECTION

The Gnomonic Projection cannot be made to include the whole hemisphere. The Stereographic and Globular Projections can be extended to include more than the hemisphere.

This is an equal area projection. The complete circle on the map is made to equal the world hemisphere. Parallels are so drawn that the zone enclosed by them bears the same relation to the area of the circle as the similar zone on the earth bears to the hemisphere. The meridians are ellipses cutting the parallels at equal distances.

SIMPLE CONIC PROJECTION

Diagram showing the Principle of the Projection: cone A B C unrolled upon sphere and touching it at PP.

Portion of Surface of Cone spread out representing map. P'P' the parallel where the cone coincides with the sphere.

The Plane of the Projection is the surface of an imaginary Cone imposed on the Sphere and touching its surface along the parallel of 40°-PP'. Distances measured along that parallel on the map are absolutely correct as they exactly coincide with the globe. But the scale is distorted to the north and south of tangential parallel according to distance away from it.

SECANT CONIC PROJECTION

Diagram showing the Principle of the Projection: cone A B C unrolled upon sphere and touching it at PP, PP'.

Portion of Surface of Cone spread out representing map. P'P' P'P' the parallels where the cone coincides with the sphere.

The Cone is in this case supposed to be sunk into the Sphere so that it cuts its surface along two parallels PP and P'P' and the map has therefore the advantage of coinciding with the globe along two parallels instead of one as in the simple conic.

BONNE'S PROJECTION

This is another form of Conic Projection and differs from the Secant Conic in that while on the Secant Conic distances are correctly measured along two parallels on Bonne's true distances are measured along each parallel.

VAN DER GRINTEN'S PROJECTION

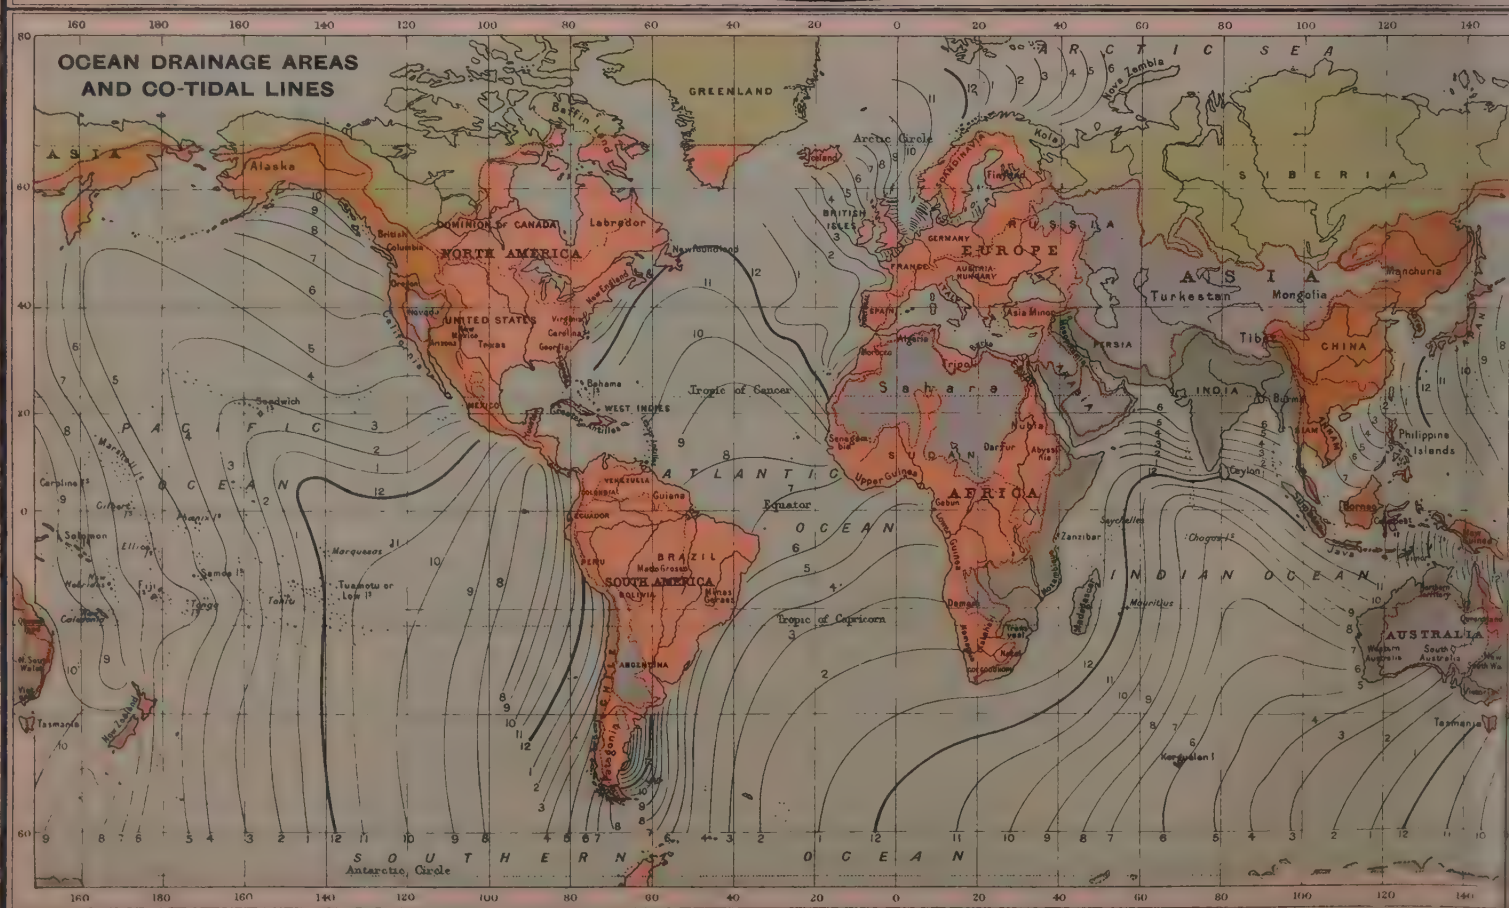

This projection strikes a mean between Mercator's and Mollweide's. It has neither the great exaggeration of land areas towards the Pole of the former, nor the excessive angular distortion of the latter.

COVERING OF A 2½ INCH WORLD GLOBE IN GORES

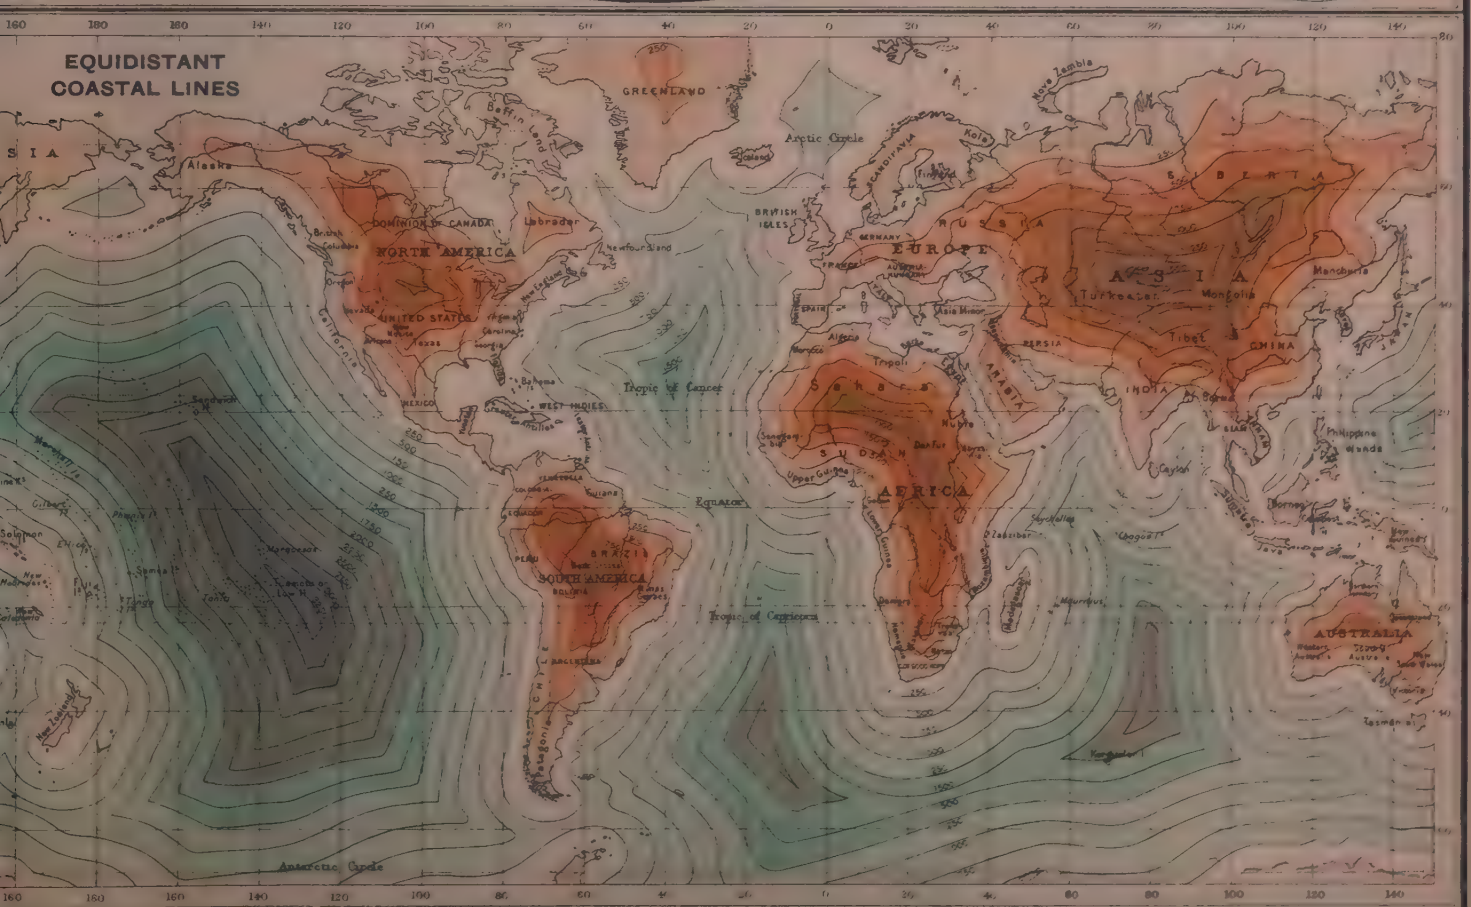

Note: These gores are designed to be cut out and mounted on a Globe 2½ inches in diameter which they will exactly cover.
